Footwear Technologies

The Merrell commitment to technology and innovation is a core tenet of the brand.

We continuously seek out the best solutions to enhance the outdoor experience for our users. Whether it is through partnerships with industry leaders or development of proprietary technologies, our pursuit of increasing comfort and enjoyment in the outdoors is relentless, and our list of applied technologies is ever growing and evolving.

It is for this reason we have begun building a repository to capture and explain the key ingredients that make up our footwear. The following pages provide an overview for technologies where more information is available.

1. Insoles

We use a variety of insoles tuned to end use, but all of them are structured, highly flexible and light. They are designed to provide support while still allowing the foot to flex naturally. Each one we use gently supports key areas of the foot to encourage muscles to stay in a relaxed, athletic position. This helps reduce foot fatigue, which, over time, may help prevent injury.

In addition to our standard premium insoles found in almost all of our footwear, we also have COMFORTBASE™ and Kinetic Fit™, which provides additional comfort and support.

COMFORTBASE™ Active Technology

COMFORTBASE™ Active contoured footbed for all-day comfort. Multi-density layers of material, an extended arch and a deeper heel cup, provide active biomechanical support to the areas of the foot most prone to fatigue.

COMFORTBASE™ Technology

COMFORTBASE™ footbed technology designed with a PU-base material and a mesh-lined breathable foam top sheet that cradles your foot in all-day comfort.

KINETIC FIT™
FLEXIBLE SUPPORT INSOLES

Kinetic Fit

Shoes with Kinetic Fit insoles are contoured like your foot, providing flexible support during athletic activity. Kinetic Fit™ ADVANCED insoles feature additional support structures in the heel, arch, and forefoot.

2. Insulation

Different winter conditions and activity levels call for different strategies for ensuring that feet stay warm and comfortable. Merrell offers a variety of insulations to provide the ideal level of warmth based on wearing conditions and activity. This allows us to tailor the weight, flexibility, and thermal retention of our shoes to a variety of outdoor pursuits.

Most of our winter boots use our standard premium low-bulk synthetic insulation, which is waterproof and warm. In some instances, we use branded insulations from trusted partners to deliver a greater warmth to weight ratio for higher-output outdoor activities.

3M™ Thinsulate™

3M™ Thinsulate™ Water-Resistant Insulation, the original thin insulation designed specifically for footwear.

PrimaLoft® Gold Insulation Aerogel

PrimaLoft® Gold Insulation Aerogel is an innovative breakthrough that offers unprecedented performance in the face of extreme conditions. It maintains its insulative properties even when compressed, making it ideal for footwear.

3. Lacing

Merrell offers a variety of lacing solutions based on end use and activity needs. For the majority of these, we control the manufacturing process in conjunction with the creation of the footwear itself. The partnership below represents a departure based on the specific and unique design of the BOA system.

BOA®

Fit to go further.™

The award-winning Boa System delivers closure and adjustment solutions purpose-built for performance. Boa's patented system consists of three integral parts: a micro-adjustable dial, super-strong lightweight laces, and low-friction lace guides. Each unique configuration is engineered to optimize fit and provide precision, adaptability, and control. The Boa System dials and laces are guaranteed for the lifetime of the product on which they are integrated.

Merrell uses the Boa L-SERIES system because its lightweight, versatile design is ideal for outdoor performance footwear. The L-SERIES is for the agile athlete who needs meticulous adjustment capabilities for ultimate comfort, adaptability, and overall performance. The L-SERIES can increase precision in single or dual zones, for the most dialed-in fit.

4. Engineered Materials

“Off the roll” is what shoe designers call picking out standard materials to build a shoe. These materials are produced in large sheets of the same repeated stitches, and are then cut out to the desired shape and sewn into the shoe. But at Merrell, we believe that “standard” doesn’t always cut it in the outdoors. That’s why we developed customized, unique-to-Merrell materials that meet the durability and quality standards you’ve come to expect from Merrell, engineered to perform during all of your life’s amazing adventures.

E-mesh

Unlike regular mesh, which is made up of uniform, repeated stitches, E-Mesh is strategically knit and layered in patterns to provide zones of flexibility, breathability, and durability precisely where they're needed in the shoe.

Jacquard

Using a process similar to that in which the woven label on the inside of your shirts is made, Jacquard is specifically woven into layers of multiple crisscrossing threads which provide protection that's lighter weight, more flexible, and more durable than most other materials.

2D Knit

The components for 2D Knit shoes are individually knit from a single thread, shoe by shoe, which results in a comfortable, durable, seam-free shoe with 4-way stretch that can adapt to the moving foot without restriction.

STRATAFUSE™

Stratafuse™ injects TPU into the fabric upper, binding it to the mesh to provide structure and support in targeted areas of the foot. Fusing TPU with this patented process (instead of melting or applying it to the mesh with an adhesive) improves durability and uses less TPU, which reduces overall weight for lightweight protection.

5. Midsoles and Platforms

Merrell lets you find the right “ride” for any terrain with a variety of midsole and platform technologies to enhance the support, protection, and comfort offered by our footwear. Most of our shoes feature standard premium EVA foam, which balances comfort, ground connection, shock absorption, and durability for a predictable and dependable ride.

We sometimes pair our midsole foam with technologies that enhance certain features. Other times, we replace the standard foam altogether with branded options that deliver on a specific performance need depending on the end-use.

FLEXPLATE™

Tuned Stability and Protection

Merrell FlexPlate™ technology integrates a lightweight, full foot stability plate with strategically-placed outsole pods to provide stability, underfoot protection, durability, and integrated grip. Variable material composition offers optimal rigidity at one end of the plate and optimal flexibility at the other.

Get more information -MRL_2017_TechChapter-flexplate

FLEXCONNECT™

Enhanced Ground Connection

Merrell FLEXconnect® technology supports the natural flexing of a foot in motion to enhance agility on any terrain. Anatomically-inspired, bidirectional flex grooves allow the foot to move naturally on uneven ground, providing improved ground connection and stability.

Air cushion - Targeted heel cushioning

Air Cushion technology improves the overall comfort of a shoe by placing an impact-absorbing pod under the heel to reduce stress on the foot with each step. The pliable material lessens impact during heel strike, and helps cradle the heel to maintain proper alignment during step-through resulting in greater comfort all day.

Get more information - MRL_2017_TechChapter-air cushion

Air cushion+ - Lightweight full-foot cushioning for all-day comfort

Dimpled for your pleasure, our Air Cushion+ technology provides a combination of solutions for the ultimate heel-to-toe air ride cushioning experience. Its dimpled design both reduces weight and creates cushioning air pockets that run the length of the foot. An additional heel insert reduces heel impact for even more comfort. Air Cushion+ also goes a step beyond cushioning with strategically-placed lugs designed to further reduce the overall weight of the shoe while still providing exceptional durability and traction.

Get more information - MRL_2017_TechChapter-air cushion

Bloom

BLOOM makes flexible foams from algae biomass which clean and restore the environment when harvested. They help keep natural ecologies in balance, and in return, we get an incredible renewable resource that helps us offset the use of petroleum in traditional footwear foams. Shoes made from Bloom Algae Foam components are the result of 225 bottles of filtered water returned to the habitat, and 21 balloons of CO2 kept from entering the atmosphere*.

*Men's size 9 insole + midsole, 200g, 25% algae masterbatch.

FloatPro®

Shoes that come with FloatPro® foam midsoles provide a lightweight ride that lasts. We know that lightweight cushioning often comes with a durability trade-off. That's why we worked with our chemists to create a foam that saves weight compared to standard EVA. This featherweight formulation cushions, protects and maintains its resiliency, potentially increasing the life of your shoes.

FloatECo®

Delivering lightweight, durable comfort and made with zero waste, not chemical additives, and no VOCs.

6. Traction

Traction is one of the most important factors in feeling confident on your feet. Different weather conditions, activities, and terrain call for different levels of grip, durability, and lug design for optimal performance and comfort. We have a variety of traction solutions for every season and terrain, from slushy city streets to rugged mountain trails.

Our standard rubber balances stickiness and durability, for well-rounded traction on a variety of terrains and surfaces. In some instances, we use branded rubbers from trusted partners to deliver even greater traction for high performance activities.

Mountain-Grade Traction, Even While Moving at Speed

Trail athletes who move fast over boulders and scree consistently tell us traction is their #1 concern. We worked for over two years to formulate Quantum Grip, a durable rubber compound that enables confidence in the most extreme trail environments.

VIBRAM® ECODURA – RECYCLED PERFORMANCE & DURABILITY

A Merrell exclusive, Vibram® Ecodura is made from a minimum of 30% recycled rubber. This high-quality compound formulation sacrifices none of the performance and durability that you've come to expect from Vibram and Merrell.

Vibram® - Unparalleled grip for outdoor terrain

Formulated exclusively for Merrell, Vibram® compound provides exceptional traction for outdoor multi-sport activities backed by the outstanding durability that Vibram® is known for.

Vibram® Megagrip - Unparalleled grip on wet and dry surfaces

Vibram® Megagrip is a high performance rubber compound featuring unparalleled grip on wet and dry surfaces. It offers the optimal balance of grippiness and durability for outdoor activities.

Vibram® Arctic Grip all terrain - Extra durable Wet ice technology

Vibram® Arctic Grip All Terrain offers all of the same cold weather performance features as regular Arctic Grip, plus greater durability and increased traction through mixed winter conditions.

7. Waterproof and Weather Protection

When it comes to weather-proofing footwear, there is no one-size-fits-all or single “best” approach. Merrell uses a variety of techniques, taking into consideration factors such as end use, conditions, exertion level, aesthetics, and fit.

This means that we can provide ideal solutions from trail shoes to pack hike boots to casual styles worn on city commutes. At Merrell our goal is to not let nature be a barrier to enjoying the outside world.

Durable Water Repellent

A first line of defense against the elements, DWR wards off surface moisture and resists stains from water, dirt, and mud.

Seam Sealing

Our seam sealing technique provides reliable weatherproofness ideal for casual footwear.

Waterproof Membrane

Our waterproof membrane offers a combination of breathability and waterproofness which is ideal for low-to-moderate outdoor activities.

Guaranteed to Keep You Dry™

Footwear with GORE-TEX® membrane is “Guaranteed to keep you dry” and offers an enhanced level of breathability which is ideal for high-exertion outdoor activities.

More Comfort. Faster Dry-Out. Less Weight.

Engineered specifically for running shoes, GORE-TEX® Invisible Fit technology provides fully waterproof and highly breathable performance with the fit and feel of non-protective running shoes.

Want More Info?

Check out the Technology Manual folder on the Digital Media Hub for downloadable content for each of the technologies.

Sustainability

Sustainability is not a fixed goal, but a responsibility to continuously pursue a better path.

We know we're not going to single-handedly save the planet. But when your passion and your business is getting people out into nature, trying to minimize your environmental impact is just what you do.

Our Materials

Recycled Materials

We continuously search for opportunities to bring new life to both pre- and post-consumer recycled materials within our supply chain. From using fabric made from single use water bottles or ocean plastic, to regrinding factory waste to make new shoe components, we believe it's our responsibility to use as much recycled content in our products as possible while balancing performance and durability.

Recycled Polyester

Recycled polyester (for example, single use water bottles) retains all of the key properties of virgin polyester while making use of an omnipresent post-consumer waste stream: plastics. We use recycled polyester in our sock line and reduce our use of virgin polyester when possible.

Recycled Rubber

Through partnerships with our materials suppliers, we've been able to incorporate post-industrial scrap rubber into the soles of some of our shoes. In fact, the soles of our new Gridway collection contain 30% recycled rubber.

Recycled EVA

We reuse EVA scrap from the midsole manufacturing process in a variety of our shoes. For example, our Gridway collection features midsoles with 40% recycled EVA and insoles with 50% recycled EVA. We are always looking for ways to incorporate more repurposed material when possible.

Leather

As a brand that annually uses over 15,000,000 square feet of leather, we know that making our leather products as environmentally friendly as possible is one of our biggest opportunities to reduce our overall environmental impact. That's why back in 2006 we joined the Leather Working Group (LWG) as an early adopter to establish strong environmental stewardship practices. Over the past decade, the LWG has worked to improve leather manufacturing by creating alignment on environmental priorities, establishing best practices, and providing guidelines for continuous improvement. In fact, LWG-certified manufacturers combined save an average of 12.1 billion liters of water and 775 megawatts of energy every year.

Traceability

The leather used in our shoes is a byproduct of the meat industry, and we have protocols in place to ensure our hides are sourced from suppliers that can certify that their origins meet our standards.

Gold and Silver Rated Tanneries

2019, 99% of our leather came from gold or silver rated tanneries. This means they have scored at or near the very top in five categories related to best practices of environmentally responsible leather production.

Natural Materials

Natural materials, such as wool and cotton are renewable resources that can be an environmentally friendly material option when sourced appropriately. That's why we have established guidelines for incorporating a variety of sustainably produced natural materials in our products.

Wool

Wool is an eco-friendly material choice because it comes from a renewable source, it can be recycled, and it is naturally biodegradable. We are currently investigating our wool supply chain and working to ensure all wool comes from humanely raised sheep.

Down

We have committed to only using Responsible Down Standard (RDS)-certified down in our products. The RDS is an independent, voluntary global standard that aims to ensure that down and feathers come from animals that have not been subjected to unnecessary harm.

Probiotic Odor Control

The anti-odor treatment we use on our insoles is made of naturally occurring microbes similar to those found in yogurt or kombucha. The treatment is non-toxic to people and safe for the environment.

Our Manufacturing

Durability

Durability is at the core of sustainability for Merrell. We pride ourselves on creating products that hold up to extensive wear, which means fewer products in the waste stream over time.

Outsoles

Durability is at the core of sustainability for Merrell. We pride ourselves on creating products that hold up to extensive wear, which means fewer products in the waste stream over time.

Upper Materials

Our leather and textile materials are engineered with abrasion resistance and durability in mind to ensure that our shoes hold up over time.

Water Conservation

We believe everyone has a responsibility to use water thoughtfully, and we strive to reduce the amount of water used in the production of our footwear and apparel.

Solution-Dyeing

The traditional method of coloring fabrics is extremely water intensive. Solution-dyeing is an alternative process that uses less than a third as much water as traditional dyeing. We are researching solution-dyed fabrics for a portion of our line.

Leather Tanning

We partner with suppliers who are committed to the responsible use and treatment of water, and have adopted best practices related to water resources as established by the Leather Working Group (LWG). 2019, 99% of our leather came from gold or silver rated tanneries, the two highest offered by LWG.

Reduce Landfill Waste

Any production process typically concludes with at least some waste materials destined for a landfill. We believe adding to landfills should be a last resort, and through recycling, process efficiency, and innovative design and production methods, we strive to reduce our contribution to landfills.

One Piece Uppers

Production of the knit uppers in products like our Gridway collection creates virtually no waste because each component is custom knit to size. This means that there are minimal scraps or off-cuts to send to a landfill.

Injection Molding

Creating molded parts like midsoles with an injection molding process results in much less waste than other processes because there is no cutting or scraps to be discarded. In fact, the molds themselves are recycled at the end of the process to further reduce waste.
